Unlike the popular belief that suggests it's a physical structure that will float above your phone under the effect of the laser of some other light, you're wrong. Hologram wallpaper refers to a wallpaper overlapped with different image structures of the same image in it, making an entirely new structure. It can depict a body, marbles, iridescent figure, liquid, clouds or have another artistic feature. It can either appear in pastel or neon colors, be more or less prominent. They can also depict an event like explosion, tide waves, or movement to look convincing. They've become increasingly popular, mostly as feature wallpapers on iPhone and flagship Android phones over the past few years. Now, there are plenty of apps where artists post or generate such images free of charges. Many apps allow you to make your own iridescent holographic image you can download to your phone in an appropriate resolution. How to set up a 3D holographic wallpaper on android? If the 3D wallpapers don't ship with your Android device or don't like them, you can make your own. There are plenty of apps on Google Play that allow users to create their own 3D holographic wallpapers and then download them on Android. Alternatively, users can also edit already-existing images on the app, add some special effects, blur out the lens and then download them to the phone. After that, setting it up as your home screen is easy. How do 3d wallpapers work? What is the science behind 3D wallpapers? They use parallax 3D effects, which basically interact with our smartphone's sensors, producing visual perception that the objects in the image are moving to the wall. With that effect, we can use any image to create that effect, especially with the use of an app. What is parallax 3D? Parallax usually depicts how we perceive an object from multiple angles. However, parallax 3D, as per PC Mag, is referred to as a type of autostereoscopic technology that splits the image into layers of columns, separating pixels into the left and right pixels. This structure gives the impression that the picture is moving. Parallax 3D uses a special opaque barrier layer that splits the screen with vertical slits so that eyes can perceive the holographic image. The technology is now often implemented into camera lenses and has its application in video gaming, in a situation where the player has a fixed position. The technology has allowed us to use parallax 3D to create visually appealing holographic images. With the use of the ten apps we highlighted below, you can find various 3D hologram wallpapers, or maybe even create your own. 3D WALLPAPER PARALLAX BACKGROUND BACKGROUNDS 4K/3D LIVE WALLPAPERS 4K/4K AMOLED LOCKSCREEN - 3D EFFECT 3D PARALLAX WALLPAPERS 4K MOVING WALLPAPER CRACKED SCREEN 3D Wallpaper Parallax - 4D Backgrounds Price: Free with ads/ Offers IAP Our top choice includes 3D Wallpaper Parallax that offers beautiful and mesmerizing 4D backgrounds.
