

Can i install android 10 on my phone

Continue

How can i install windows 10 on my android phone. Can i install android 10 on my old phone.

You can download Android 10, Google's latest operating system, on many different phones now. Until Android 11 rolls out, this is the newest version of the OS you can use. While some phones like the Samsung Galaxy S20 and OnePlus 8 came with Android 10 already available on the phone, most handsets from the last few years will need it downloaded and installed before it can be used. Unlike iOS, Android isn't always too insistent on you getting the newest operating system too, so sometimes it's not immediately clear how to upgrade. Many smartphones can download the Android 10 update - too many to list here - but generally speaking, if you have a handset from the last few years, especially a top-end one, you can probably get Android 10. It's worth checking with the phone company, and your operator, to be sure though. If you have a device that'll run Android 10, we'll show you how. It couldn't be easier, and will give you access to all new features like dark mode and compatibility for Face ID-style facial recognition when you buy apps or make in-app purchases. So without wasting your time further, this is how to download Android 10 on your phone. Before we start, it's worth starting these instructions are for 'stock' Android as you'll find on Google Pixel and some other smartphones. Companies like Huawei and Xiaomi create 'forked' Androids for their phones, which are slightly different in a few ways, and you may find the menus are laid out slightly differently to how we describe. The instructions all should work, though. First, find the Settings app in your phone. That's a very easy ask, as it'll usually come on the first page of your apps when you buy a new phone, and there's little reason to move it. From here, either use the settings search option, or scroll down to find 'System'. Select this option. Now, find the 'Advanced' tab at the bottom, and open it up. The last of these options is 'System update', which you should select. You should be presented with loads of information about Android 10, as well as the option to download it to your phone. If this isn't the case, either you're already on Android 10, or your phone isn't compatible at this time. Either way, bad luck. Start the update and the phone will do the work from here. Make sure it's connected to Wi-Fi if you don't want to use up your data allowance, and if your phone is low on battery it's worth keeping the handset plugged in. Only Google's phones for now! (Image credit: TechRadar) After some time, Android 10 will be downloaded. You'll have to restart your phone to get it to work properly, but when you're back in, you'll be welcomed into the newest Android operating system. Congratulations! Why not celebrate this upgrade by checking out the puzzle game hidden in Android 10? To get started with Android 10, you'll need a hardware device or emulator running Android 10 for testing and development. You can get Android 10 in any of these ways: Google Pixel device If you have a qualified Google Pixel device, you can check & update your Android version to receive Android 10 over the air. Alternatively, if you'd rather flash your device manually, you can get the Android 10 system image for your device on the Pixel downloads page. Read the general instructions for how to flash a system image to your device. This approach can be useful when you need more control over testing, such as for automated testing or regression testing. In most cases, you don't need to do a full reset of your data to move to Android 10, but it's recommended that you back up data before enrolling your device. Android 10 is available for Pixel 3/3a and 3/3a XL, Pixel 2 and 2 XL, as well as Pixel and Pixel XL. Partner device You can use any device from our ecosystem of partners for development and testing on Android 10. It's important to make sure the device you use is certified to provide official support for Android 10. For device availability and official support for Android 10, please check with your device manufacturer or a carrier store in your region. For support on your device, visit the device manufacturer's support site. Qualified Treble-compliant device For broader testing on a variety of Treble-compliant devices, you can download and flash a Generic System Image (GSI) to your device. Visit the GSI page for details on how to flash a GSI image to your device. Android Emulator If you don't have access to a hardware device that can run Android 10, we recommend setting up an Android Emulator for development and testing. Configuring the Android Emulator to run Android 10 is a great solution for exploring new features and APIs and testing with Android 10 behavior changes. Setting up the emulator is fast and convenient and allows you to emulate various screen sizes and device characteristics. You can even emulate a foldable device (in Android Studio 3.5 and later). To set up an emulator with Android 10, install the latest system image and create a new virtual device as follows: In Android Studio, click Tools > SDK Manager. In the SDK Platforms tab, select Show Package Details at the bottom of the window. Below Android 10.0 (29), select a system image such as Google Play Intel x86 Atom System Image. In the SDK Tools tab, select the latest version of Android Emulator. Click OK to begin the install. After install is finished, select Tools > AVD Manager and follow the instructions to create a new AVD. Be sure to select a device definition that does not include Play Store, and select 29 for the system image. When you return to the AVD Manager's list of virtual devices, double-click your new virtual device to launch it. In August we learned Google was rebranding its Android effort, and that included plans to ditch dessert names going forward. Today the latest version of Android finally moved out of beta, and as promised is now officially called simply Android 10. As you can imagine, Android 10 will take months to reach most devices but for lucky Pixel owners you can get in on the fun starting today. Below is a quick guide on how to install Android 10 on your Pixel. Method 1: Download the OTA update Android 9 Pie update tracker: When will your phone get it? (Updated May 10) Features This is the easiest and generally preferred way to upgrade to Android 10, as you don't have to reinstall anything. To upgrade to Android 10 on your Pixel, head over to your phone's settings menu, select System, System update, then Check for update. If the over-the-air update is available for your Pixel, it should automatically download. Reboot your phone after the update has installed, and you'll be running Android 10 in no time! If you don't want to wait for the OTA update or want a clean slate, we've got instructions for you on how to install Android 10 via factory images and OTA files. Method 2: Flashing Android 10 on your device Flashing Android 10 on your device takes more time and work than the OTA method. If you don't want to install the over-the-air update for some reason, you can sideload the factory image or OTA file manually. Here's how to do it: Google has already posted Android 10 factory images and OTA files for all four Pixel phones. You'll need to download the proper file for your device before you get started. Here's what you need to get started: A compatible Pixel device and a USB cable to connect it to your computer. The Android SDK installed on your machine with ADB and Fastboot command successfully working - check the tutorial here. 7zip or a similar program that can handle .tgz and .tar files. An unlocked bootloader on your phone. Now let's get down to the nitty-gritty. The first thing you have to do is unlock your phone's bootloader by following the step-by-step instructions below. It's easy to do and does not require lots of technical knowledge. Unlocking the bootloader will wipe all the data off your device, so make sure you back it up first. Step-by-step instructions: Turn on developer options by going to "About Phone" and tapping "Build Number" seven times. Enable USB debugging and OEM unlock on your device in the "Developer options" section. Plug in the Pixel to your PC with a USB cable. Open the command window on your PC. Boot your Pixel device into bootloader mode using the following command: adb reboot bootloader (if it requests you to authorize this, say yes). When your device boots into bootloader mode, type in this command: fastboot flashing unlock. A confirmation screen will pop up. Press the volume up key to highlight yes and the power button to start the bootloader unlocking process. Once unlocked, your device will reboot into bootloader mode. Now you simply need to type in fastboot reboot to finish the process. Flashing Android 10 on your smartphone is pretty straightforward, but you can still run into problems if you don't carefully follow the instructions listed below. Step-by-step instructions: Head into the bootloader menu to test that your device and PC are communicating by typing in fastboot devices - if it comes back with your device's serial number, you're good to go. Prepare the factory image you downloaded earlier. Use 7zip to extract the .tgz file you downloaded and then again to extract the .tar file you extracted from the .tgz. This will create a folder with several files in it. Copy all those files and paste them in the platform-tools folder in the Android SDK on your computer. You should find it in the Program Files (x86) folder on Windows. There are two flash-all files. Windows users should double-click the one that has the gear logo and says "Windows Batch File" on the right. If you're on Linux, double-click the flash-all.sh. A box will pop up and you should see the installation taking place. While this is going on, do not unplug your device for any reason! When the installation process has finished, your device will automatically reboot. You can then disconnect your device from your computer and start playing with Android 10. For whatever reason, not everyone has luck with the Flash-all scripts. If they fail for you, there's another way. It's actually pretty simple. First, make sure you are still in the proper bootloader state and connected to your PC. On your PC you'll want to type the following: First we flash the bootloader with the following command: fastboot flash bootloader .img Next type: fastboot reboot-bootloader Now we flash the radio with the following command: fastboot flash radio .img Next type: fastboot reboot-bootloader Flash the image with: fastboot flash -w update .zip After this your device may reboot automatically, if not type: fastboot reboot Returning to Android Pie is easy as... pie Something went wrong installing Android 10 or ran into an unexpected issue? While it's better to have the latest version of Android possible, if you do run into an issue the good news is going back to Android Pie is simple. Essentially follow the same flashing steps above, but this time you don't need to unlock the bootloader and you'll simply use a Pie factory image.
