To create an Android application that saves data to the SD Card, start by setting up a new project in Android Studio. Choose "Empty Activity" and give it a name like "ex.no.9". In the app's layout file, replace the default code with a linear layout containing an EditText, three buttons for writing, reading, and clearing data, and some margins to make it look decent. Now, add the necessary permissions in the AndroidManifest.xml file by including WRITE_EXTERNAL_STORAGE and READ_EXTERNAL_STORAGE permissions. This allows your app to access and write files on the SD Card. Next, create a new Java class called MainActivity and replace its default code with the following: In this code, we're using the FileOutputStream to write data from the EditText to the SD Card when the "Write Data" button is clicked. We're also reading data from the file when the "Read data" button is pressed. After coding, run your application on a device or emulator and see how it works. This tutorial uses an Android External Storage example project that creates an app with buttons for writing and reading data to the SD Card. The external storage can be used to store various types of data, such as configuration files. public boolean isExternalStorageAvailable() { String extStorageState = Environment.getExternalStorageState(); if (Environment.MEDIA_MOUNTED.equals(extStorageState)) { return true; } return false; } getExternalStorageState() is a static method of Environment to determine if external storage is presently available or not. As you can see, if the condition is false we've disabled the save button. The activity_main.xml layout is defined as follows: `xml
